

Fuaad Abdullah

Curriculum Vitae

Finance student and developer exploring trading systems, applied decision-making, and production software as a form of real-world problem solving.

fuaadabdullah@gmail.com · heyimfuaad.me · [LinkedIn](#) · [GitHub](#)

Academic Purpose

My work sits at the intersection of finance, disciplined decision-making, and software systems. Trading pushed me toward questions about risk, information quality, and repeatable process; building tools became the way I test those questions against real behavior instead of leaving them abstract.

I am especially interested in environments that reward intellectual curiosity plus execution: define a real problem, choose a tractable scope, build something measurable, and use the results to refine the next decision.

Education

Georgia State University · B.B.A., Finance · 2020 – 2025

Selected coursework: Financial Accounting · Business Technology · Marketing Principles

Why I Build

Finance taught me to think in incentives, uncertainty, and downside. Trading made those abstractions immediate. Software became the natural extension of that mindset: a way to turn judgment into process, process into tools, and tools into feedback loops that can actually be evaluated.

I build to make uncertain workflows more legible and repeatable, whether the user is a trader sizing risk, a teacher grading faster, or a small team trying to move from messy inputs to better decisions.

Selected Projects

RIZZK Calculator

Production position-sizing and risk management tool for active day traders.

Python · Streamlit · Plotly · Docker · Azure

- **Problem / research question:** How can position sizing under time pressure become more consistent, less error-prone, and more behaviorally disciplined?
- **Approach:** Built a calculator around the actual decisions traders make in live sessions, prioritizing speed, clarity, and risk visibility over unnecessary feature sprawl.
- **Tradeoffs:** Streamlit accelerated iteration and deployment, while accepting some performance limits compared with a lower-level custom frontend.
- **Outcome:** Reduced position-size mistakes by ~90% and sped up sizing decisions by ~50% in live trading sessions.

Goblin Assistant

Production multi-provider AI assistant with routing, observability, and privacy controls.

FastAPI · Next.js · TypeScript · PostgreSQL · Redis · Docker · Fly.io · Vercel

- **Problem / research question:** How can an AI assistant become more trustworthy when model choice, latency, and provider health are usually hidden from the user?
- **Approach:** Designed a system where routing decisions and provider state remain visible, making infrastructure and interaction design part of the product itself.
- **Tradeoffs:** Accepted more operational complexity in exchange for explainability, flexibility, and privacy-aware control.

GradeM8

AI grading assistant with rubric-based feedback and production-minded test coverage.

Python · Gradio · Hugging Face · pytest

- **Problem / research question:** How can repetitive grading work be reduced without making the output too opaque or brittle to trust?
- **Approach:** Combined document parsing, structured prompts, and strong test coverage so grading support could be evaluated as a workflow, not just a demo.
- **Outcome:** Reduced routine grading time by 60-70% while maintaining reliability with 285+ tests.

Portfolio

Portfolio and case-study site designed as a public record of projects, reasoning, and measurable outcomes.

Next.js · React · TypeScript · Tailwind · MDX · Vercel

- **Problem / research question:** How should technical work be presented so it communicates both execution quality and the thinking behind it?
 - **Approach:** Treated the portfolio as a product: high-performance delivery, structured content, and case studies that foreground decisions rather than only screenshots.
 - **Outcome:** Achieved 100/100 Lighthouse scores and sub-2s load times while supporting resume and CV delivery.
